

The Allevo Business Client (ABC) enables users to work in a familiar Excel environment instead of the SAP GUI. ABC can be launched either as a standalone Windows application or directly from an Excel workbook. It establishes a secure, **bidirectional connection** to SAP, combining the **flexibility of Excel** with the power and reliability of integrated SAP data processing.

- ✓ Greater stability compared to Excel integration via the SAP GUI
- ✓ Seamless data exchange with SAP – fully SAP-compliant
- ✓ All data remains stored in SAP, including full support for authorization and security concepts

➔ How it works

The ABC opens a selection panel where users choose the desired Allevo master, layout, and business objects before logging into SAP. Once connected, the Excel-based planning workbook opens automatically and users can start working immediately.

Who is the ABC for?

The Allevo Business Client is ideal for organizations that want to:

- Simplify and streamline SAP planning processes
- Use Excel as a familiar and user-friendly planning interface
- Benefit from a flexible solution with secure SAP connectivity

If you know A and B, you'll love C: the Fiori Connector

As an **extension of the Allevo Business Client**, the Fiori Connector enables users to launch Excel-based planning directly from a Fiori tile or URL.

✓ Smart launch functionality:

Pass parameters like layouts, objects, or master data via URL to open the exact planning view in one click.

✓ More performance, greater flexibility:

Run multiple planning instances in parallel and use batch processing for significantly improved performance.

Seamless integration: Start planning processes directly from intranet, PowerPoint, email, or custom applications.
